

Molecular and biometric assessment of *Myzodium mimulicola* (Hemiptera: Aphididae), with new synonymy and host and distributional data

K.S. Pike, G. Graf, R.G. Foottit, H.E.L. Maw, G.L. Miller, J. Harpel, A. Pantoja, A. Hagerty, S. Emmert

Abstract—A molecular and biometric assessment and redescription of *Myzodium mimulicola* (Drews and Sampson) are provided. New North American host and distributional data are presented, including the first record from Alaska. *Myzodium knowltoni* (Smith and Robinson) is a junior subjective synonym of *M. mimulicola*, based on molecular-sequence and morphological evidence. A key to the known *Myzodium* species (apterae and alatae) is included.

Résumé—Nous présentons une évaluation moléculaire et biométrique, ainsi qu'une redescription de *Myzodium mimulicola* (Drews et Sampson). De nouvelles données sur la répartition en Amérique du Nord et sur les hôtes sont fournies, dont une première mention pour l'Alaska. L'étude de la morphologie et des séquences moléculaires montre que *Myzodium knowltoni* (Smith et Robinson) est un synonyme subjectif plus récent de *M. mimulicola*. Un clé permet de reconnaître les espèces connues de *Myzodium* (apterées et ailées).

[Traduit par la Rédaction]

Introduction

The aphid fauna (Hemiptera: Aphididae) of western North America is represented by a broad spectrum of species (1000+ species; see Pike *et al.* 2003) utilizing a wide range of plants. Among aphids encountered on *Mimulus* L. and *Veronica* L. (Scrophulariaceae), *Rorippa* Scop. (Brassicaceae), and mosses in forest settings, wetlands, seeps, and slow-moving waterways are species of *Myzodium* Börner. Field collections from Alaska, Idaho, Montana, Oregon, Utah, and Washington reveal that two (*M. knowltoni* Smith and Robinson and *M. mimulicola* (Drews and Sampson)) of the three species of *Myzodium*

recognized in North America are morphologically indistinguishable.

Myzodium mimulicola collected from *Mimulus guttatus* DC was originally placed in *Kakimia* Hottes and Frison (now a subgenus of *Nasonovia* Mordvilko; Remaudière and Remaudière 1997) and then in *Ovatus* Van der Goot (Eastop and Hille Ris Lambers 1976). Because of its short, distinctly shaped cauda and certain other features, Eastop and Voegelin (1990) classified it as a *Myzodium* species. At that time, whether *M. mimulicola* and *M. knowltoni* (described from moss) were separate species was unclear. Herein we place *M. knowltoni* as a subjective junior synonym of *M. mimulicola*, based on

comparisons of molecular sequences and morphological characters, add new host and distributional information, and provide a diagnostic key to the species of *Myzodium*.

Materials and methods

Our assessments of *M. mimulicola* are based on specimens from the authors' field collections taken from *Mimulus*, *Rorippa*, *Veronica*, and mosses from Alaska, Idaho, Montana, Oregon, Utah, and Washington, and from previously determined material in the Canadian National Collection, Ottawa (CNC); Essig Museum of Entomology, University of California, Berkeley (EMEC); University of Idaho, Moscow (UI); Utah State University, Logan (USU); the National Museum of Natural History Aphidoidea Collection, Beltsville, Maryland (USNM); and Washington State University (WSU). Field-collected specimens preserved in 70%–95% ethanol were cleared and slide-mounted in Canada balsam following Foottit and Maw (2000) or Hille Ris Lambers (1950) with modifications by D. Voegtlin (Illinois Natural History Survey) (Pike et al. 1991). We studied the holotype and paratypes of *M. knowltoni* and the syntypes of *M. mimulicola* and compared them with the original descriptions. For comparison, specimens of *Myzodium modestum* (Hottes) were also examined. Measurement data are based on the analysis of 58 apterae (24 specimens (including 10 syntypes) of *M. mimulicola*, 22 specimens (including the holotype and 10 paratypes) of *M. knowltoni*, and 9 specimens of *M. modestum*) and 9 alatae (including 2 syntypes) of *M. mimulicola*. Collection data for all specimens examined are presented in a standardized format organized by state and county (or borough). The following abbreviations are used for collection records: al, alate vivipara(e); ap, aptera vivipara(e); Boro., borough; CG, campground; coll., collector; Co., county; Cr., creek; ex, extracted or collected from; E, east; FR, forest road; Hwy, highway; im, immature; Jct., junction; mi., mile or miles; Mt, Mount; Mtn, mountain or mountains; N, north; ONP, Olympic National Park; Rd, road; S, south; W, west. Identifying letters in authors' collection codes (e.g., 95G009) are as follows unless otherwise indicated: G, G.

Graf; K, K.S. Pike. Anatomical and other descriptive abbreviations are as follows: ABD, abdomen or abdominal; ANT, antenna; ASIII, ASIV, etc., antennal segment 3, 4, etc.; BVI, base of ultimate antennal segment (part up to and including primary rhinarium); FT, frontal antennal tubercles; L/W, length/width ratio; PT, processus terminalis of the ultimate antennal segment (part beyond the primary rhinarium); SIPH, siphunculus; URS, ultimate rostral segment (penultimate and ultimate segments, 4+5). Morphological terminology follows Foottit and Richards (1993) and Pike et al. (2003).

Illustrations are hand-drawn from images taken with a DEC13M digital eyepiece camera through a Zeiss Axiolab compound microscope; morphological measurements (all recorded in millimetres, with segment length measured unless otherwise indicated) and character ratios are derived using image-measuring software (Pike et al. 2005).

Sequence data for mitochondrial cytochrome *c* oxidase subunit I (COI), 5' end ("DNA barcoding" region), of exemplar specimens (Table 1) selected from the authors' collections were compared to provide an indication of molecular coherence and distinctness of species. Details of specimen processing and primers follow Foottit et al. (2008). Information on sequences, collections, and taxonomy for each specimen was entered in the Barcode of Life Data System (BOLD) (Ratnasingham and Hebert 2007). All sequences obtained in this study are deposited in GenBank (Table 1). Where available, voucher specimens from the same collection sequenced are deposited in WSU or CNC. Pairwise nucleotide sequence divergences were calculated using the Kimura 2–76 parameter model of base substitution (Kimura 1980).

Results

Character comparisons

Biometric comparisons of *M. mimulicola* and *M. knowltoni* (Table 2) show that the latter, sourcing from moss, was, on average, smaller than *M. mimulicola*, but with confidence intervals that overlapped those of *M. mimulicola* for a majority of characters measured and ratios compared. *Myzodium mimulicola* and *M. knowltoni* are also alike in coloration and pigmentation (adult apterae, mounted: ABD mainly pale (Fig. 3), head and appendages (ANT, URS, legs, tarsi, SIPH, cauda) light brown to brown)) and shape of the cauda (Fig. 5). *Myzodium modestum*, though similar in size to *M. mimulicola* (Table 2), differs in coloration and pigmentation (adult apterae, mounted: ABD dorsum with large pigmented brown to dark-brown patch (Fig. 7), head and appendages brown to dark brown) and shape of the cauda (Figs. 8, 9).

Molecular sequence comparisons

Results of the comparison of COI DNA sequences for samples of the three nominal North American *Myzodium* species (Remaudière and Remaudière 1997) are given in Table 3. *Myzodium mimulicola* from *Mimulus* sp. formed a tight cluster with *M. knowltoni* from moss, with

Table 2. Biometric summary (measurements and comparisons of features) of aptera vivipara *Myzodium mimulicola*, *M. knowltoni*, and *M. modestum*.

Note: Values in parentheses are 95% confidence intervals.

^aFrom *Mimulus guttatus*, *Rorippa nasturtium-aquaticum*, and *Veronica anagallis-aquatica*.

^bFrom moss.

^cFor a redescription of the species see Smith and Robinson (1975) and Heie (1992).

^dValues represent the mean of 10 syntypes (designated cotypes on the original slides).

^ePopulation means are expected (with 95% confidence) to lie within the intervals shown.

^fSegment lengths were measured, unless otherwise indicated (AS, antennal segment; BVI, base of antennal segment VI; L/W, length/width ratio; PT, processus terminalis; SIPH, siphunculus; URS, ultimate rostral segment).

^gMeasured at the midpoint of the segment.

Figs. 1–9. *Myzodium* spp. 1–6, *Myzodium mimulicola*, aptera vivipara: 1, head; 2, hind tarsus; 3, abdomen with minimal dorsal pigmentation; 4, siphunculus; 5, cauda; alate vivipara: 6, cauda. 7–9, *Myzodium modestum*, aptera vivipara: 7, abdomen with extensive dorsal pigmentation; 8, cauda; alate vivipara: 9, cauda. Scale bars: 0.10 mm for Figs. 1, 3, 4, 7; 0.05 mm for Figs. 2, 5, 6, 8, 9.

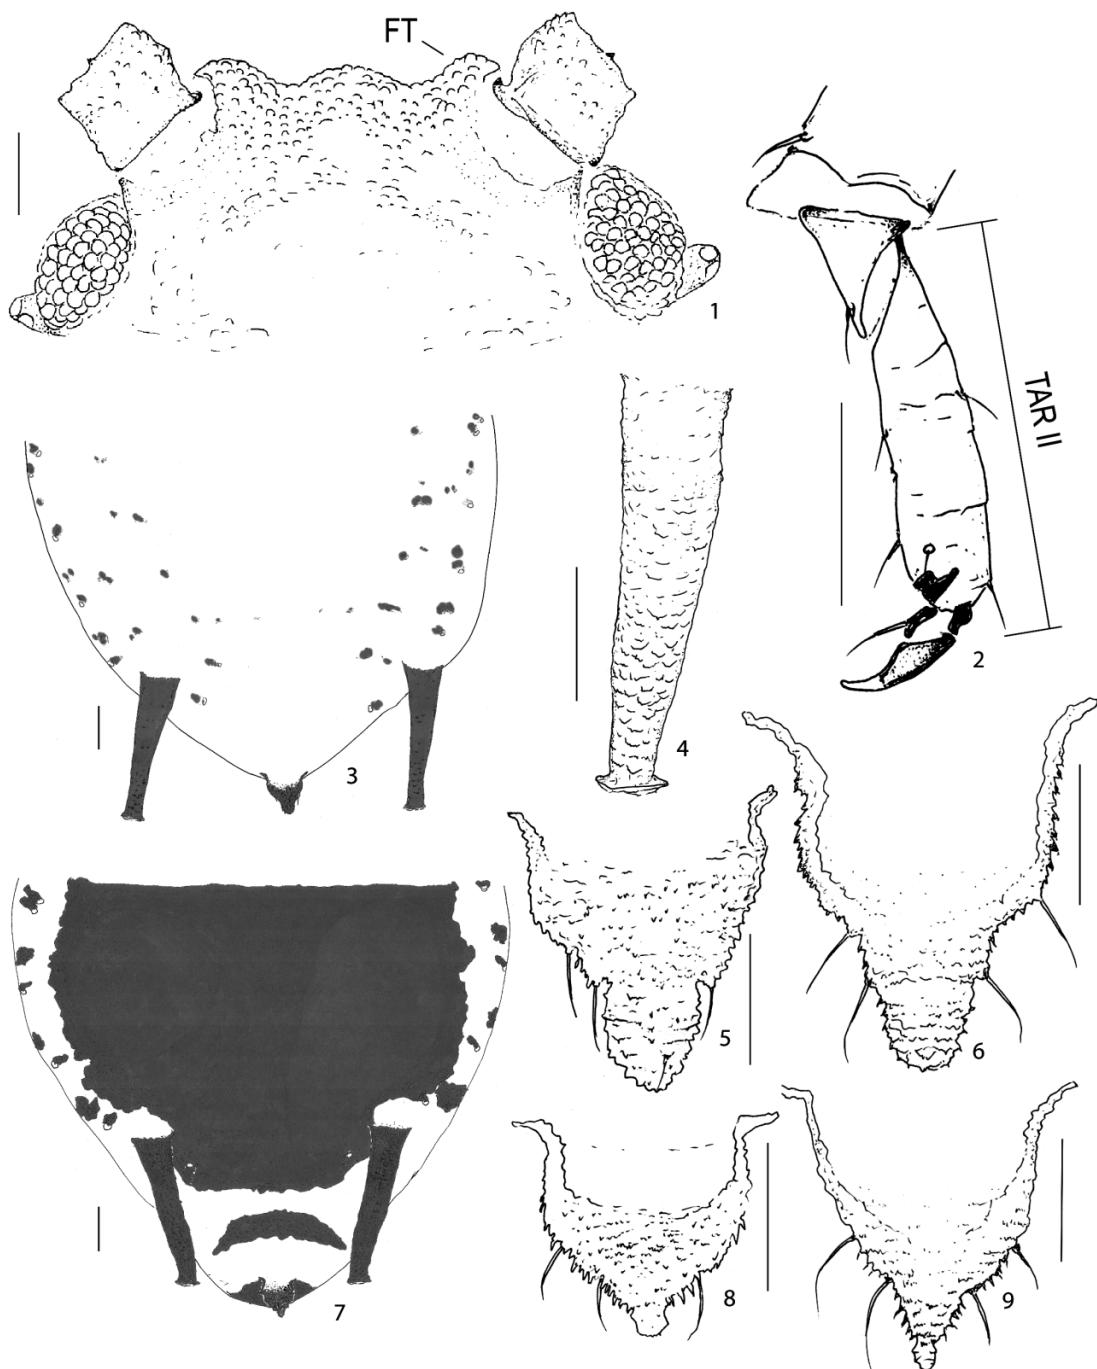

Table 3. Summary of distances (percent sequence difference) among *Myzodium* taxa.

	<i>Myzodium knowltoni</i>	<i>Myzodium mimulicola</i>	<i>Myzodium modestum</i>
<i>Myzodium knowltoni</i> (<i>n</i> = 6)	0.46	0–0.46	6.25–7.14
<i>Myzodium mimulicola</i> (<i>n</i> = 2)		0.15	6.25–6.78
<i>Myzodium modestum</i> (<i>n</i> = 22)			0.31

Note: The range of divergences between specimens of nominal taxa is given above the diagonal, and maximum observed divergences within nominal taxa are given on the diagonal.

a maximum pairwise divergence among samples of 0.46%, typical of within-species variation observed in other aphid species (Footitt *et al.* 2008). *Myzodium modestum* is clearly differentiated; the mean pairwise distance between the *M. mimulicola*–*knowltoni* group and *M. modestum* was 6.67% (range 6.25%–7.14%).

New synonymy

Myzodium mimulicola and *M. knowltoni* have virtually identical morphology, and COI sequences of each sample from *Mimulus* are identical with those of samples from moss. We therefore consider the samples from moss and those from vascular plants to belong to a single species. Because the original description of *M. mimulicola* (Drews and Sampson 1937) predates that of *M. knowltoni* (Smith and Robinson 1975), we propose *M. knowltoni* as a subjective junior synonym of *M. mimulicola*. Presently, there are three species in the genus: *M. lutescens* (Zhang and Qiao) from China (Zhang and Qiao 1998; Eastop and Blackman 2005) and *M. mimulicola* and *M. modestum* from North America (*M. modestum* also occurs in Europe).

Redescription

Myzodium mimulicola (Drews and Sampson)

(Figs. 1–6)

Syntypes of *Kakimia mimulicola* (female apterae and alatae): **UNITED STATES OF AMERICA. California:** Alameda Co., Berkeley, 4.x.1937, coll. E.A. Drews and W.W. Sampson; Marin Co. (EMEC) and Inverness, 13.iv.1936, coll. E.A. Drews and W.W. Sampson (EMEC); **Holotype** of *Myzodium knowltoni* (female aptera):

UNITED STATES OF AMERICA. Utah: Cache Co., Logan Canyon, 12.viii.1962 (USNM).

Description

Female aptera.

Color: Live, brownish green with some orange color between SIPH; mounted, body mainly pale, head and appendages (ANT, URS, legs, tarsi, SIPH, cauda) light brown to brown.

Body: 0.81–2.04 mm.

Head: Surface conspicuously nodulose; head width = 1.34–2.10 × ASIII; median tubercle developed; FT developed, rounded, divergent; ANT < body length (0.60–0.95 × body length) and without secondary rhinaria, ASI–ASII rough, nodulose to spiculose, ASIII–ASBIV imbricated, with sparse setae, very short and stout, <0.4 × ASIII midwidth; PT > 2 × BVI; URS elongate, 2.18–3.46 × basal width, with 2–4 accessory setae; rostrum reaching to or slightly beyond metacoxae.

Thorax and ABD: dorsal surface reticulate; marginal tubercles lacking; hind tarsus II < URS (0.60–0.75 × URS); tarsal I chaetotaxy 3-3-2; claws simple; empodial setae acuminate, reaching to tip of claws; SIPH strongly imbricated, gradually tapering (narrowing) from base to preapex; flange distinctive, 1.31–1.66 × narrowest part of SIPH; cauda with 4–6 setae (usually 2 lateral pairs, 1 preapical).

Description

Female alate.

Body: 1.80–2.10 mm.

Head: Head width = 0.42–0.49 mm; ANT < body length (0.78–0.85 × body length); ASIII = 0.37–0.44 mm; ASIV = 0.26–0.34 mm; ASV = 0.20–0.26 mm; PT = 2.52–2.80 × BVI; secondary rhinaria = ASIII (21–32), ASIV (8–11), and ASV (0–6); URS L/W = 2.60–3.42.

Thorax and ABD: hind femur = 0.47–0.61 mm; hind tibia = 0.87–1.11 mm; hind tarsus II = 0.05–0.11 mm, and 0.34–0.76 × URS; tarsal I chaetotaxy 3-3-2; SIPH = 0.27–0.33 mm, L/W = 3.20–4.15, and 2.41–3.05 × cauda; ABD dorsum with dark pigmented patch, or patch partially separating into transverse bars; cauda shape comparable to that of aptera, with 4 or 5 setae, length = 0.10–0.13 mm, L/W = 0.95–1.20.

Ovipara and male

Not examined.

Host plants

The species occurs on vascular plants (*Mimulus guttatus* (seep monkeyflower), *M. floribundus* Douglas ex Lindl. (manyflowered monkey-

flower) (Blackman and Eastop 2006), *Rorippa nasturtium-aquaticum* (watercress), and *Veronica anagallis-aquatica* (water speedwell)) and non-vascular plants (six new moss associations reported; see records of specimens examined). It is occasionally abundant on *Mimulus* and *Veronica*, but always sparse on other hosts.

Distribution

The species has a broad western Nearctic distribution, ranging from central California east to Utah, and north to southeastern Alaska (**new record**). The species was previously known in California, Idaho, Montana, Oregon, Utah, Washington, and British Columbia (Smith and Parron 1978; Pike *et al.* 2003).

Key to *Myzodium* (alate and aptera viviparae)

Acknowledgments

We thank L. Boydston, J. Fulbright, D. Graf, R. Groenendale, and W.J. Turner (WSU), L. Pike (Prosser, Washington), and B. Kunibe, S. Lillard, R. Ranft, D. Fleming, and R. Pampell (United States Department of Agriculture, Agricultural Research Service (USDA, ARS), Alaska) for assistance in field collecting and (or) mounting. We also thank the following for loaning specimens or making collections available for study: C.B. Barr (EMEC), W.J. Hanson and C. von Dohlen (USU), and F. Merickel (UI). DNA sequencing was supported through funding of the Canadian Barcode of Life Network from Genome Canada (through the Ontario Genomics Institute), the Natural Sciences and

Engineering Research Council of Canada, and other sponsors listed at www.BOLNET.ca. We appreciate reviews of the manuscript by R. Ochoa (USDA, ARS, Systematic Entomology Laboratory, Beltsville, Maryland) and G. Evans (USDA, Animal and Plant Health Inspection Service, Plant Protection and Quarantine, Beltsville, Maryland).
